

## Backend Developer (f/m/d)

Our Backend-team develops Microservices and APIs, in order to safely persist the data and dependencies of entire IT architectures of our customers. In order to allow sophisticated, blazing fast analysis and visualization, we rely on special purpose storage technologies. Besides relational databases, we use document-centric, graph-oriented or time-series-databases. As Java Developer you enrich our team, that builds intelligent APIs which are used by our single-page-app frontends or directly by our customers.

Two week sprints based on SCRUM help our teams to self-organize their tasks and continuously improve our platform for our customers. Thanks to our highly automated toolchain based on GitHub, Jenkins, Docker and Ansible we work test-driven to a large extent and make use of Continuous Integration and Deployment.

### WHAT IS WAITING FOR YOU?

---

- Implementation of scalable & secure backend services in Java
- Design and implementation of robust REST APIs and GraphQL API
- Agile development according to SCRUM
- Improvement of our architecture
- Highly motivated and experienced colleagues that enjoy working as a team
- State of the art technologies in frontend and backend
- Test-driven development and continuous integration

### WHAT IS OUR STACK?

---

- Java 11, incl. Dropwizard
- Kafka
- Modern toolchain, e.g. Maven, Git flow, GraphQL API, Jenkins, Docker, Ansible, nginx, NewRelic, IntelliJ IDEA
- Microservices built with Java, Postgres and Elasticsearch
- Docker and Kubernetes

### WHAT ARE WE LOOKING FOR?

---

- Degree educated
- 1+ years working experience
- Working proficiency with Java
- Working experience with modern tools and workflows
- Open communication style
- Able to anticipate and solve problems
- Quality awareness
- Being an Elastic Search Expert or Workflow Engine Expert is a major plus
